For a setup guide that includes step by step instuctions and screenshots, go to
http://accounts.your-site.com/support/index.php?_m=troubleshooter&_a=steps&troubleshootercatid=13&parentid=0

These are the most common settings for Android phones, based on Android 4.+ . Your phone or app might be slightly different, but these settings should give you enough information to properly configure your phone.

1. Start the mail app
2. Select â€œOther(POP3/IMAP)â€•
3. Select â€œManual Setupâ€•
4 Select "IMAP account"
5. Username: Your full email address
6. Password: Email account password
7. IMAP Server: imap.your-site.com (make sure you use this and not your website name)
8. Security Type: TLS accept all certificates
9. Nothing else needs to be changed
10. Select â€œNextâ€• and wait while mail validates your settings

Most settings are correct on the next screen. Verify these are correct:

1. SMTP Server: smtp.your-site.com (make sure you use this and not your website name)
2. Security Type: TLS accept all certificates
3. Server Port: 587
4. Require sign-in is checked
5. Username: Your full email address
6. Password: Email account password
7. Select â€œNextâ€• and wait while mail validates your settings

"Account Options" settings are up to you. When these are set, hit "Next".

"Give this account a name" is for your information only. No one else will see this. Customize the â€œYour nameâ€• field how you would like people to see your name appear on emails. This will appear before your email address like â€œYour-Site Support â€• in our example.
